Samenvatting van GB901083

901,083. Lighters using liquid fuel. VAN POPPEL, A. M. J., and VAN POPPEL, A., [trading as HANDELSONDERNEMING GEB. VAN POPPEL]. Jan. 26, 1960, No. 2831/60. Class 75 (3). In a lighter comprising a reservoir 2 for a low-boiling-point liquid, a lever 5 for opening a valve 4 biased by a spring 20 to two positions and a flint wheel 10, the lever 5 has two side-plates which overlie two upstanding walls 14 supporting the shaft 6 on which the flint wheel and the lever rotate and a ribbed grip 7 connecting the two side-plates overlaps in both positions of the lever a curved wall 16 interconnecting the two upstanding walls 14. The two upstanding walls 14 and the curved wall 16 are parts of a block 15 having a projection 29 engaging beneath an abutment 17 on a holder 1; the block 15 is held down on a seat 18 of the holder 1 by the threaded tube 19 holding the flint. The flint wheel 10 is rotated by a leaf-spring 11 co-operating with teeth on the side of the flint wheel and having a recess engaged by a projection 13 on the lever 5. The bias spring 20 surrounds the flint tube 19 and presses upwardly a block 21 slidable on the flint tube and connected by links 23 with the side-plates of the lever 5.
